AI Engineer | Agents, Multi-Agent Workflows & RAG

PROFESSIONAL SUMMARY

AI engineer with a Master of Data Science (The University of Melbourne) and a Bachelor of Engineering in Computer Science, who owns AI features end to end in Python, from design through evaluation to delivery. Built a multi-agent support-ticket triage system where an LLM orchestrates five tool-based agents through an MCP server, with guardrails, human review, budget caps and a rigorous evaluation harness. Built an event-driven AI system on AWS Bedrock, Lambda, EventBridge and DynamoDB, deployed containerised inference on Lambda and ECR, and at Enspyr Australia built model routing and evaluation workflows that cut cost per call by approximately 20%. Uses AI coding tools (Claude Code, Codex) daily and critically reviews every generated change.

KEY SKILLS

AI Agents: Tool-calling agents, multi-agent orchestration and workflows, Claude Agent SDK, MCP, LangChain, RAG and GraphRAG, AI voice agents

Prompt Engineering & Evaluation: Production prompt tuning, structured outputs, golden datasets, LLM-as-a-judge, locked test sets, bootstrap confidence intervals, regression checks

AWS: Amazon Bedrock, Lambda, EventBridge (Scheduler), DynamoDB, S3, ECR, Glue; Docker containers

Enterprise & Financial Data: REST API integration with business systems, BigQuery, PostgreSQL, Neo4j, sales and pricing data, fraud and claims data, reconciliation

Python: FastAPI, Pydantic, pandas, pytest, async workflows, REST APIs

AI-Assisted Development: Claude Code, Codex; critically reviewing, testing and validating generated code

Quality & Delivery: Guardrails, PII redaction, human-in-the-loop review, cost and token tracking, structured logging, Git, GitHub Actions CI/CD

SELECTED PROJECTS

Support Ticket Triage Agents – Multi-Agent System | github.com/meghanaganapa/support-ticket-triage-agent
Python, Claude Agent SDK, MCP server, FastAPI, scikit-learn, pytest, GitHub Actions, Docker

- Built a multi-agent system where an LLM orchestrator calls five specialist agents as tools (classifier, priority, knowledge retrieval, responder, guardrail) through an in-process MCP server.
- Enforced reliability in code: priority floors the LLM cannot lower, guardrails re-run on every reply, a human review gate, per-ticket budget caps and turn limits, and an offline fallback; every run is traced and costed.
- Built an evaluation harness with a locked, checksum-verified test set and paired bootstrap tests, lifting routing accuracy from 80.0% to 86.7% and auto-handled tickets from 44.4% to 62.2%.

GridFlex AI – Event-Driven GenAI on AWS | github.com/meghanaganapa/gridflex-ai-aws
Python, Amazon Bedrock, Lambda, EventBridge Scheduler, DynamoDB

- Built an event-driven pipeline where scheduled Lambdas simulate energy telemetry, apply decision logic and call Amazon Bedrock to generate explainable EV charging and battery recommendations, stored in DynamoDB.
- The related WattWise idea won the Watt the Hack Pitching Challenge.

Fraud Claim Detection – Containerised Inference on AWS | github.com/meghanaganapa/fraud-claim-detection-agent
Python, Docker, AWS Lambda, ECR, XGBoost, LightGBM, CatBoost

- Containerised a scoring service with Docker and deployed it on AWS Lambda via ECR, returning a probability, risk level and recommended action.

PROFESSIONAL EXPERIENCE

AI Engineer **May 2026 – Present**
Enspyr Australia

- Built a model routing system that classifies each prompt by complexity and domain and sends it to the most suitable LLM, reducing cost per call by approximately 20%.
- Built evaluation workflows benchmarking OpenAI, Claude and Gemini on quality, latency and cost, with automated log validation that made review approximately 2x faster.
- Building AI voice agents with RAG and tuning prompts for production, designed so a new domain is added by swapping knowledge files.

AI/ML Engineer **Jun 2026 – Jul 2026**
Twelfth AI

- Owned features of a production RAG/GraphRAG agent for a national retailer over BigQuery, PostgreSQL and Neo4j, reducing category managers' research time by approximately 30%.
- Evaluated quality with golden-question sets, LLM-as-a-judge scoring and human review, and added guarded retrieval and confidence labels for traceable answers.

Data Engineer Intern **May 2025 – Jul 2025**
JurisTechne

- Built Python pipelines and services deployed on Kubernetes, reducing manual collection by approximately 30%.

Research Intern **Feb 2023 – May 2023**
Melbourne Data Analytics Platform, The University of Melbourne

- Designed controlled ML experiments that improved accuracy by approximately 15%.

Associate Software Engineer **Sep 2022 – Dec 2022**
Qentelli Solutions

- Built backend components and API integrations, reducing manual processing by approximately 30%.

Software Engineer Intern **Feb 2022 – Aug 2022**
Accolite Digital

- Developed tested Java APIs with CI/CD, reducing manual regression testing by approximately 20%.

EDUCATION & ACHIEVEMENTS

- Master of Data Science, The University of Melbourne
- Bachelor of Engineering in Computer Science and Engineering, Vasavi College of Engineering
- AWS Certified Cloud Practitioner; Databricks Fundamentals; Winner, Watt the Hack Pitching Challenge
